

Operators

1. Take two numbers from the user and perform addition, subtraction, multiplication, and division. Print the result of each operation.
2. Take two numbers as input and use the equality operator (==) to print whether they are equal or not.
3. Take a number as input and check if it is divisible by both 5 and 11. [Check Divisibility]
4. Find the largest among three numbers using relational operators (>, &&).
5. Take a person's age as input and use a relational operator to determine if they are eligible to vote (age >= 18).
6. Take a number and use relational operators to determine if it is positive, negative, or zero.
7. Check if a given year is a leap year. A year is a leap year if it is divisible by 4, except for end-of-century years, which must be divisible by 400. (e.g., 2000 is a leap year, 1900 is not).
8. Declare an integer variable, then demonstrate the use of pre-increment (++a), post-increment (a++), pre-decrement (--a), and post-decrement (a--) operators, printing the value at each step.
9. Compound Assignment: Show the use of compound assignment operators (+=, -=, *=, /=, %=) on a variable.
10. Take a number as input and use the modulo operator (%) to determine if it is even or odd.
11. Take a character as input and check if it is a vowel or a consonant.
