

- Q1. Write a Java program that takes a five digit token number from the user. Then it generates a new number from the token number following some rules. The new number is a combination of the first two digits followed by the last two digits of the token. Finally, check whether the new number is divisible by the third digit of the token number. Display the token number, the new number, and whether it is divisible by the third digit of the token. However, if the third digit is 0, then check if the new number is divisible by 3.

Sample Input	Sample Output	Explanation
Token = 12345	Token: 12345 New number: <u>1245</u> It is divisible by 3	Token = 12345 First 2 digit = 12 Last 2 digit = 45 Combination of last and first 2 digit = 1245 Third digit = 3 1245 is divisible by 3.
Token = 14086	Token: 14086 New number: 1486 It is not divisible by 3	Token = 14086 The token is even. First 2 digit = 14 Last 2 digit = 86 Combination of last and first 2 digit = 1486 Third digit = 0 Hence, we check if divisible by 3. 1486 is not divisible by 3.

int num1;

(num1 = num)

If

Q2. Write the corresponding Java code of the given flowchart.
