

Department of Computer Science and Engineering

SET: A

Course: CSE110

Examination: Quiz 3

Semester: Spring 2026

Name: Rafi Uddin Bhuiyan Sifat

Duration: 20 min

Marks: 10

ID: 1000058427

1. Write a Java program to calculate the weighted average. To do this, multiply each number by its corresponding weight, sum these products, and then divide the result by the sum of all the weights.

[10]

Given arrays:

Int[] values = {1, 3, 5, 7, 9};

Int[] weights = {10, 20, 30, 50, 40};

Sample Output:

6.2

Explanation:

here the mean will be $((1 * 10) + (3 * 20) + (5 * 30) + (7 * 50) + (9 * 40)) / (10 + 20 + 30 + 50 + 40)$, which equals to 6.2.
